What needs to be done:

-create and execute a shell interface that allows for the running of other programs and a set
of built-in functions

        --> so creating different processes?

-the command line runs in loop : get user input, recieve input, process input and reset for next
input

-add a space after the dollar sign (design)

-tokens : keep commands in an array?

-has to be able to handle non-built in commands
-has to handle built in commands: exit and cd
